Alameda County Roads: Critical Connectivity for Every Mode

Highways, arterials, and major roads are important connectors for both goods and people making local and regional trips. Many of these roads serve multiple users, including bicycles, pedestrians, cars, public transit, trucks and emergency vehicles. They connect communities to employment, activity centers, and other important destinations.

**IMPORTANCE OF HIGHWAYS, ARTERIALS, AND MAJOR ROADS**

*Support all transportation modes:* Alameda County’s roadway network provides critical connectivity for cyclists, pedestrians, transit riders, trucks and cars.

*Provide direct access to housing, employment, and activity centers:* Arterials and major roads are the critical link between the regional and local transportation networks. They provide connections to home, work and almost every other destination.

*Support growth of jobs and housing:* Highways, arterials and major roads support existing land uses, and can provide opportunities to support planned land uses.

*Continuous and connected network for all modes:* Local governments, limited by the existing right-of-way, cannot increase vehicle capacity to keep pace with demand. Instead, cities are increasing overall person-throughput by designing streets to be safe and convenient for all modes, each of which should have a complete, continuous and connected network available.

**At-a-Glance:**

- 3,978 total miles of roadways in Alameda County include:
  - 70 miles on 11 highways
  - 1,200 miles of arterials
  - 2,700 miles of major local roads

*Directional miles of LOS-F as defined in Alameda CTC 2018 LOS Monitoring Report page 18.

### ARTERIALS AND MAJOR ROADS
Alameda CTC has a designated Congestion Management Program network which evaluates roadway performance every two years. This information is reported in charts and graphs as part of this fact sheet.

### LOCAL ROADS
Local jurisdictions manage a network of about 3,500 miles of roads and report on their condition annually.
Arterial and Road Performance

In 2018, even as congestion on freeways and highways stabilized — congestion on arterial roads continued to build as a result of an improving regional economy and sustained job growth. Pavement conditions on these roads, however, are improving as a result of state and local investments.

**Auto travel speeds declining**

Morning and afternoon peak travel speeds on arterials decreased about 15 percent each in the last four years. Travel speeds on arterial roads continued to fall in 2018 even as speeds on freeways and highways remained stable.

**Bus Transit speeds falling**

All bus operators speeds dropped for the second consecutive year. Building congestion on arterial roads has slowed bus service, as well as cars and trucks. Speed differences between operators reflects the built environment and the nature of service.

**Local road conditions improving**

Nearly half of all roads now rated Very Good or Excellent. After remaining stable over the last decade, an influx of funding from Measure BB likely improved conditions on many roads. Almost half of roads are now rated “excellent or very good”, while about 1,000 miles (24%) are still rated “at risk, poor, or failing”. In 2017, countywide average Pavement Condition Index (PCI) was near the 2011 all time high of 70.
Challenges and Opportunities for Major Roads

Highways, arterials, and major roads serve a unique role as a connector between the regional and local transportation systems and directly link to local land uses (commercial and residential corridors). They must facilitate throughput for all modes and support local land use.

**CHALLENGES**

**Demand for roadway use is rising:** Regional economic and population growth have increased demand for goods and services, and a variety of users, including cars, transit, bikes, and trucks are competing to access the same roads.

**Trip Diversion:** Widespread congestion on freeways diverts trips onto adjacent arterials and local roads. The proliferation of wayfinding apps has exacerbated this problem, opening more local roads to cut-through traffic.

**OPPORTUNITIES**

**Complete streets:** Every city in Alameda County has adopted complete streets policies, which ensure that all projects, including basic street repaving, will look for opportunities to improve biking, walking, and transit.

**Multimodal Arterial Plan:** The Countywide Multimodal Arterial Plan provides a roadmap for a future with improved mobility for all modes on a continuous and connected network, which can increase the efficiency and throughput of the entire transportation system.

**Reducing conflict through design:** Thoughtful facility design, operation, and maintenance can increase efficiency by reducing auto and transit delay and improve safety for all modes by reducing the severity of collisions. This promotes public health and creates vibrant local communities.

**Advanced technologies:** Emerging technologies can improve the operational efficiency of roadways while also supporting alternative modes and vulnerable users.

**Traffic Volume:**

40 percent of daily trips in Alameda County carried by 1,200 miles of arterials

**Pavement Conditions:**

Almost half of locally-managed roadways rated “excellent or very good”

24 percent or 1,000 miles rated “at risk, poor, or failing”
